

## ETHER V.2

Go to a grey jungle. Slide up the power switch. The yellow LED shows that ETHER is ready to take you to a sound journey.

Use the upper wheel (high-frequency amplification and regeneration) for focusing ETHER on the most interesting dynamical layer of sound. The stronger source the lower amplification has to be.

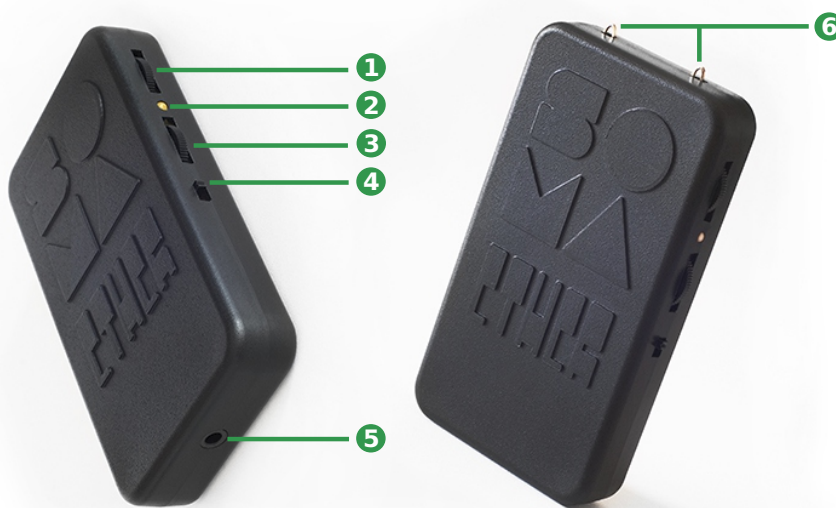

Use the lower wheel (volume) to mix ETHER sound with your brainwaves in the best proportion.

NOTE: in the high position of the VOLUME and AMPLIFICATION wheels ETHER may get to a self-feedback and start to produce crackles. To avoid this don't set both wheels close to the maximum simultaneously. Use sensitive and not "deaf" headphones so you can work with low volume set.

Move, checking different points and directions in space.

Check by one or both external antenna pins different conductive objects. Touch it by your fingers. Try to use a piece of wire connected to it finding more cool sounds.

If you have found the Hidden Sound Treasure, stay still for a while, breathing deeply and thinking about the meaning of life...

**1 Amplification wheel** - in quiet environments set it closer to maximum, in noisy ones - closer to its minimum.

**2 LED diode** - signals that the power is on.

**3 Volume wheel.**

**4 Power switch.**

**5 Headphone/line output** jack 3.5mm stereo. We recommend using sensitive, low-impedance headphones such as Koss Porta Pro.

**6 Antenna pins** - touch them with your fingers or hold them against metallic objects.

## SPECIFICATION:

Size: . . . . . 103x58x17 mm

Weight: . . . . . 73g (with batteries)

Power: . . . . . 2x AAA (alkaline or lithium batteries)

Output: . . . . . 3.5 mm stereo mini-jack

In order to put the batteries (2 AAA) inside, unscrew the four screws on the bottom of the enclosure.
